

## Objectives

- Wrap up arithmetic
- A few programming tricks
- String operations
- Formatting output

Jan 20, 2010

Sprenkle - CSCI111

1

## Modulo Operator: %

- Modular Arithmetic: Remainder from division
  - $x \% y$  = the remainder of  $x/y$
  - Read as "x mod y"
- Example:  $6 \% 4$ 
  - Read as "six mod four"
  - $6/4$  is 1 with a remainder of 2, so  $6\%4$  evaluates to 2
- Works only with integers
  - Typically just positive numbers
- Precedence rules: P E - DM% AS

Jan 20, 2010

Sprenkle - CSCI111

2

## Modulo Practice

- $7 \% 2 =$
- $3 \% 6 =$
- $6 \% 2 =$
- $7 \% 14 =$
- $14 \% 7 =$
- $6 \% 0 =$

3

## Brainstorm

- What useful thing does  $\% 10$  do?
  - $3 \% 10 =$
  - $51 \% 10 =$
  - $40 \% 10 =$
  - $678 \% 10 =$
  - $12543 \% 10 =$
- What useful thing does  $/10$  do (integer division)?
  - $3/10 =$
  - $51/10 =$
  - $40/10 =$
  - $678/10 =$
  - $12543 / 10 =$
- What useful thing does  $\% 2$  do?

## Trick #1: Type Conversion

- You can convert a variable's type
  - Use the type's **constructor**

Conversion Function/ Constructor	Example	Value Returned
<code>int(&lt;number or string&gt;)</code>	<code>int(3.77)</code> <code>int("33")</code>	3 33
<code>long(&lt;number or string&gt;)</code>	<code>long(12)</code> <code>long("13")</code>	12L 13L
<code>float(&lt;number or string&gt;)</code>	<code>float(22)</code>	22.0
<code>str(&lt;any value&gt;)</code>	<code>str(99)</code>	"99"

Sprenkle - CSCI111

5

## Trick #2: Arithmetic Shorthands

- Called **extended assignment operators**
- Increment Operator
  - $x = x + 1$  can be written as  $x += 1$
- Decrement Operator
  - $x = x - 1$  can be written as  $x -= 1$
- Shorthands are similar for  $*$ ,  $/$ :
  - $x /= 2$
  - `amount *= 1.05`

6

## Programming, Testing Practice

- Average three numbers
  - What are good test cases?

average3.py

Jan 20, 2010

Sprenkle - CSCI111

7

## Programming, Testing Practice

- Average three numbers
  - What are good test cases?
  - How can we make sure we get a floating point number?
    - Two alternatives

average3.py

8

## STRING OPERATIONS

Jan 20, 2010

Sprenkle - CSCI111

9

## String Operations

Operand	Syntax	Meaning
+	<code>str1 + str2</code>	Concatenate two strings into one string
*	<code>str * num</code>	Concatenate string <code>num</code> times

- Examples:
  - `str = "I feel " + "sleepy"`
  - `str = "Oops! " * 3`

10

## Motivating Constants

- Let's say I have a survey program that asks people to rate something on a scale of 1 to 10
- I ask people to rate 100 different things
- I could create the prompt  
`"Rank " + thing + " on a scale of 1 to 10"`
- But what if my scale changes, and I want it to be on a scale of 1 to 100?
  - I want to make sure the ranking is within my range

11

## Constants

- Special variables whose values are defined once and never changed
  - By convention, not enforced
- By convention
  - A constant's name is all caps
  - Typically defined at top of program → easy to find, change
- Examples:  
`SCALE_MIN = 1`  
`SCALE_MAX = 10`  
Never assigned values in remainder of program

Jan 20, 2010

Sprenkle - CSCI111

12

## Practice

- Given the following code

```
SCALE_MIN = 1
SCALE_MAX = 10
prompt = ...
rating = input( prompt )
```

- Create the string variable `prompt` for the `input` statement so that it prompts the user:

On a scale of 1 to 10, how much do you like Matt Damon?

Jan 20, 2010

Sprenkle - CSCI111

`scale.py`

13

## Strings: `str`

- Used for text
- Indicated by double quotes `""` or single quotes `'`
  - In general, I'll use double quotes
  - Empty string: `""` or `'`
- Use triple quotes `"""` for strings that go across multiple lines

```
"""This string
is long.
Like, really, really long """
```

Sprenkle - CSCI111

14

## Escape Sequences

- Escape Sequences
  - newline character (carriage return) -> `\n`
  - tab -> `\t`
  - quote -> `\'`
  - backslash -> `\\`
- Example:
  - print "To print a `\\`, you must use `\\\"\\\\\\\\\\\"`"
    - What does this display?

Shell demonstration

Jan 20, 2010

Sprenkle - CSCI111

`demo_str.py`

15

## Practice

- Display To print a tab, you must use `'\t'`.
- Display I said, "How are you?"

`escape_sequence.py`
