

## Objectives

- Introduction to problem solving
  - Our process, through an example

Jan 13, 2010

CS211

1

## Matching Residents to Hospitals

- **Goal:** Given a set of preferences among hospitals and medical school students, design a *self-reinforcing* admissions process.
- Applicant  $x$  and hospital  $y$  are **unstable** if
  - $x$  prefers  $y$  to its assigned hospital
  - $y$  prefers  $x$  to one of its admitted students
- **Stable assignment:** Assignment with no unstable pairs
  - Natural and desirable condition
  - Individual self-interest will prevent unstable applicant/hospital deal from being made

What details make this problem tricky?

## Stable Matching Problem

*Simplified version of resident-matching problem*

- Goal: Given  $n$  men and  $n$  women, find a "suitable" matching
  - Participants rank members of opposite sex
  - Each man lists women in order of preference from best to worst
  - Each woman lists men in order of preference from best to worst

3

## Stable Matching Goals

- **Perfect matching:** everyone is matched monogamously
  - Each man is paired with exactly one woman
  - Each woman is paired with exactly one man
- **Stability:** no incentive for some pair of participants to undermine assignment by joint action
  - An *unmatched* pair  $m-w$  is **unstable** if man  $m$  and woman  $w$  prefer each other to current partners
  - Unstable pair  $m-w$  could each improve by eloping
- **Stable matching:** perfect matching with no unstable pairs

### Stable matching problem:

Given the preference lists of  $n$  men and  $n$  women, find a stable matching if one exists.

Jan 13, 2010

CS211

4

## Analyzing Stability

- Is pairing X-C, Y-B, Z-A stable?
  - **Instable:**  $m$  prefers  $w$  to his woman;  $w$  prefers  $m$  to her man

## Any Questions?

- What are you wondering about this problem/ its solution at this point?

Jan 13, 2010

CS211

8

## Any Questions?

- What are you wondering about this problem/ its solution at this point?
- Hopefully:
  - Is there a stable matching for every pair of preference lists?
  - If so, is there an algorithm to find the stable matching?
  - Can we be fair in the matching? (preferences)
  - Will the matching always be the same?

Jan 13, 2010

CS211

9

## Propose-And-Reject Algorithm

[Gale-Shapley 1962]

- Intuitive method that guarantees finding a stable matching

```

Initialize each person to be free
while (some man is free and hasn't proposed to every woman)
  Choose such a man m
  w = 1st woman on m's list to whom m has not yet proposed
  if (w is free)
    assign m and w to be engaged
  else if (w prefers m to her fiancé m')
    assign m and w to be engaged and m' to be free
  else
    w rejects m

```

Bertha	Xavier	Yancey	Zeus
Clare	Xavier	Yancey	Zeus

Women's Preference Profile

```

Initialize each person to be free
while (some man is free and hasn't proposed to every woman)
  Choose such a man m
  w = 1st woman on m's list to whom m has not yet proposed
  if (w is free)
    assign m and w to be engaged
  else if (w prefers m to her fiancé m')
    assign m and w to be engaged and m' to be free
  else
    w rejects m

```

## Observations about the Algorithm

- What can we say about any woman's partner during the execution of the algorithm?
- How does a woman's state change over the execution of the algorithm?
- What can we say about a man's partner?

Jan 13, 2010

CS211

12

### Observations about the Algorithm

- What can we say about any woman's partner during the execution of the algorithm?
  - **Observation 1.** He gets "better" → she prefers him over her last partner
- How does a woman's state change over the execution of the algorithm?
  - **Observation 2.** Once a woman is matched, she never becomes unmatched; she only "trades up"
- What can we say about a man's partner?
  - **Observation 3.** She gets "worse"

Jan 13, 2010

CS211

13

### Proof of Correctness: Termination

- **Claim.** Algorithm terminates after at most  $n^2$  iterations of while loop.
  - Hint: How wouldn't the algorithm terminate?

Jan 13, 2010

CS211

14

### Proof of Correctness: Termination

- **Claim.** Algorithm terminates after at most  $n^2$  iterations of while loop.
- **Pf.** Each time through the while loop, a man proposes to a new woman. There are only  $n^2$  possible proposals.

$$n(n-1) + 1 \text{ proposals required}$$

Jan 13, 2010

CS211

15

### Algorithm Analysis

Prove that final matching is a *perfect* matching

- Hint: in algorithm, we know if  $m$  is free at some point in the execution of the algorithm, then there is a woman to whom he has not yet proposed.

Jan 13, 2010

CS211

16

### Proof of Correctness: Perfection

- **Claim.** All men and women get matched.
- **Pf.** (by contradiction)
  - Where should we start?

Jan 13, 2010

CS211

17

### Proof of Correctness: Perfection

- **Claim.** All men and women get matched.
- **Pf.** (by contradiction)
  - Suppose that  $m$  is not matched upon termination of algorithm
  - Then some woman, say  $w$ , is not matched upon termination.
  - By Observation 2,  $w$  was never proposed to.
  - But, last man proposes to everyone, since he ends up unmatched
    - (by the while loop's condition)
  - **Contradiction** ■

Jan 13, 2010

CS211

18

## Proof of Correctness: Stability

- Claim. No unstable pairs.

How will we prove this?

$S^*$
Amy-Yancey
Bertha-Zeus
...

Jan 13, 2010

CS211

19

## Proof of Correctness: Stability

- Claim. No unstable pairs.

- Pf. (by contradiction)

- Suppose A-Z is an unstable pair: each prefers each other to partner in Gale-Shapley matching  $S^*$ .

How could that happen?  
What are the possibilities that lead to this?

$S^*$
Amy-Yancey
Bertha-Zeus
...

Jan 13, 2010

CS211

20

## Proof of Correctness: Stability

- Claim. No unstable pairs.

- Pf. (by contradiction)

- Suppose A-Z is an unstable pair: each prefers each other to partner in Gale-Shapley matching  $S^*$ .
- Case 1: Z never proposed to A.
  - $\Rightarrow$  Z prefers his GS partner to A. men propose in decreasing order of preference
  - $\Rightarrow$  A-Z is stable.
- Case 2: Z proposed to A.
  - $\Rightarrow$  A rejected Z (right away or later) women only trade up
  - $\Rightarrow$  A prefers her GS partner to Z.
  - $\Rightarrow$  A-Z is stable.
- In either case A-Z is stable, a contradiction. ■

$S^*$
Amy-Yancey
Bertha-Zeus
...

CS211

21

## Summary So Far...

- Stable matching problem.** Given  $n$  men and  $n$  women and their preferences, find a stable matching if one exists.
- Gale-Shapley algorithm.** Guarantees to find a stable matching for *any* input

### Remaining Questions:

- How to implement GS algorithm efficiently?
- If there are multiple stable matchings, which one does GS find? (see book)

Jan 13, 2010

CS211

22

## How Can We Implement The Algorithm Efficiently?

- What is our goal for the implementation's runtime?

Jan 13, 2010

CS211

23

## Efficient Implementation

- Representing men and women
  - Assume men are named  $1, \dots, n$
  - Assume women are named  $1', \dots, n'$
- Preferences
  - Two  $n \times n$  arrays
- Engagements
  - Maintain a list of free men, e.g., in a queue.
  - Maintain two arrays `wife[m]`, and `husband[w]`.
    - Set entry to  $\emptyset$  if unmatched
    - If  $m$  matched to  $w$  then `wife[m]=w` and `husband[w]=m`
- Men proposing
  - For each man, maintain a list of women, ordered by preference.
  - Maintain an array `count[m]` that counts the number of proposals made by man  $m$ .

Jan 13, 2010

CS211

24

## Efficient Implementation

- Women rejecting/accepting: determine does woman  $w$  prefer man  $m$  to man  $m'$ ?
  - For each woman, create *inverse* of preference list of men
  - Constant time access for each query after  $O(n)$  preprocessing

Amy	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	4 <sup>th</sup>	5 <sup>th</sup>	6 <sup>th</sup>	7 <sup>th</sup>	8 <sup>th</sup>
Pref	8	3	7	1	4	5	6	2

Amy	1	2	3	4	5	6	7	8
Inverse	4 <sup>th</sup>	8 <sup>th</sup>	2 <sup>nd</sup>	5 <sup>th</sup>	6 <sup>th</sup>	7 <sup>th</sup>	3 <sup>rd</sup>	1 <sup>st</sup>

Amy prefers man 3 to 6  
since  $\text{inverse}[3] < \text{inverse}[6]$

```
for i = 1 to n
  inverse[ pref[i] ] = i
```

Jan 13, 2010

25

## Review: Our Process

1. Understand/identify problem
  - Simplify as appropriate
2. Design a solution
3. Analyze
  - Correctness, efficiency
  - May need to go back to step 2 and try again
4. Implement
  - Within bounds shown in analysis

Jan 13, 2010

CS211

26

## Stable Matching Summary

- **Stable matching problem.** Given preference profiles of  $n$  men and  $n$  women, find a *stable* matching.
  - no man and woman prefer to be with each other than assigned partner
- **Gale-Shapley algorithm.** Finds a stable matching in  $O(n^2)$  time.
  - Can implement algorithm *efficiently*
