

## Objectives

- Greedy Algorithms
  - Interval partitioning
  - Minimizing Lateness
- Greedy stays ahead
- Exchange argument

Feb 4, 2011

CSCI211 - Sprenkle

1

## Review: Greedy Algorithm Template

- Consider jobs (or whatever) in some order
  - Decision: What order is best?
- Take each job provided it's compatible with the ones already taken

Feb 4, 2011

CSCI211 - Sprenkle

2

## Greedy Algorithms

- At each step, take as much as you can get
  - Feasible – satisfy problem's constraints
  - Locally optimal – best local choice among available feasible choices
  - Irrevocable – after decided, no going back

## Interval Partitioning: Lower Bound on Optimal Solution

- **Def.** The depth of a set of open intervals is the maximum number that contain any given time.
- **Key observation.** # of classrooms needed  $\geq$  depth.
- **Ex:** Depth of schedule below = 3  $\Rightarrow$  schedule below is optimal.

## Interval Partitioning: Greedy Algorithm

- Consider lectures in increasing order of start time: assign lecture to any compatible classroom

```

Sort intervals by starting time so that  $s_1 \leq s_2 \leq \dots \leq s_n$ 
 $d = 0$ 
for  $j = 1$  to  $n$ 
  if (lecture  $j$  is compatible with some classroom  $k$ )
    schedule lecture  $j$  in classroom  $k$ 
  else
    allocate a new classroom  $d + 1$ 
    schedule lecture  $j$  in classroom  $d + 1$ 
     $d = d + 1$ 
  
```

- Implementation:  $O(n \log n)$ 
  - For each classroom  $k$ , maintain the finish time of the last job added.
  - Keep the classrooms in a priority queue by last job finish time.

CSCI211 - Sprenkle

5

## Interval Partitioning: Greedy Analysis

- **Observation.** Greedy algorithm never schedules two incompatible lectures in the same classroom
- **Theorem.** Greedy algorithm is optimal
- **Pf Intuition**
  - When do we add more classrooms?
  - When would we add the  $d+1$  classroom?

Feb 4, 2011

CSCI211 - Sprenkle

6

## Interval Partitioning: Greedy Analysis

- **Observation.** Greedy algorithm never schedules two incompatible lectures in the same classroom
- **Theorem.** Greedy algorithm is optimal
- **Pf.**
  - Let  $d$  = number of classrooms that greedy algorithm allocates
  - Classroom  $d$  is opened because we needed to schedule a job, say  $j$ , that is incompatible with all  $d-1$  other classrooms
  - Since we sorted by start time, all these incompatibilities are caused by lectures that start no later than  $s_j$
  - Thus, we have  $d$  lectures overlapping at time  $s_j + \epsilon$
  - $d$  is the depth of the set of lectures

7

## Proving Greedy Algorithms Work

- Specifically, produce an **optimal** solution
- Approaches:
  - Greedy algorithm stays ahead
    - Does better than any other algorithm at each step
  - Exchange argument
    - Transform any solution into a greedy solution
  - Structural Argument
    - Figure out some structural bound that all solutions must meet

Feb 4, 2011

CSCI211 - Sprenkle

8

Exchange argument

## SCHEDULING TO MINIMIZE LATENESS

Feb 4, 2011

CSCI211 - Sprenkle

9

## Scheduling to Minimizing Lateness

- Single resource processes one job at a time
- Job  $j$  requires  $t_j$  units of processing time and is due at time  $d_j$  (its deadline)
- If  $j$  starts at time  $s_j$ , it finishes at time  $f_j = s_j + t_j$
- **Lateness:**  $\ell_j = \max \{ 0, f_j - d_j \}$
- **Goal:** schedule all jobs to **minimize maximum lateness**  $L = \max \ell_j$

## Developing Greedy Algorithms

- What do we want to optimize?
- What order?
  - Intuition of order?
  - Counter examples for order being optimal?

Feb 4, 2011

CSCI211 - Sprenkle

11

## Minimizing Lateness: Possible Orderings

- **Shortest processing time first.** Consider jobs in ascending order of processing time  $t_j$ .

Counter example

	1	2
$t_j$	1	10
$d_j$	100	10

- **Smallest slack.** Consider jobs in ascending order of slack  $d_j - t_j$ .

Counter example

	1	2
$t_j$	1	10
$d_j$	2	10

Feb 4, 2011

CSCI211 - Sprenkle

12

## Minimizing Lateness: Greedy Algorithm

- Earliest deadline first.

```

Sort n jobs by deadline so that  $d_1 \leq d_2 \leq \dots \leq d_n$ 
 $t = 0$ 
for  $j = 1$  to  $n$ 
  Assign job  $j$  to interval  $[t, t + t_j]$ 
   $s_j = t$ 
   $f_j = t + t_j$ 
   $t = t + t_j$ 
output intervals  $[s_j, f_j]$ 

```

Feb 4, 2011

CSCI211 - Sprenkle

13

## Minimizing Lateness: No Idle Time

- Observation. There exists an optimal schedule with no idle time

- Observation. The greedy schedule has no idle time

Feb 4, 2011

CSCI211 - Sprenkle

14

## Proving Optimality

- Goal: Prove greedy algorithm produces optimal solution
- Approach: Exchange argument
  - Start with an optimal schedule Opt
  - Gradually modify Opt
    - Preserving its optimality
  - Transform into a schedule identical to greedy's schedule

Feb 4, 2011

CSCI211 - Sprenkle

15

## Minimizing Lateness: Inversions

- Def. An **inversion** in schedule  $S$  is a pair of jobs  $i$  and  $j$  such that:  
 $d_i < d_j$  but  $j$  scheduled before  $i$

Can Greedy's solution have any inversions?

Feb 4, 2011

CSCI211 - Sprenkle

16

## Minimizing Lateness: Inversions

- Def. An **inversion** in schedule  $S$  is a pair of jobs  $i$  and  $j$  such that:  
 $d_i < d_j$  but  $j$  scheduled before  $i$

Greedy's schedule has no inversions!

Feb 4, 2011

CSCI211 - Sprenkle

17

## Minimizing Lateness: Inversions

- Claim. Swapping two adjacent jobs with the same deadline does not increase the max lateness
- Pf Sketch. Let  $\ell$  be the lateness before the swap, and let  $\ell'$  be it afterwards
  - Lateness of other jobs?
  - Lateness of  $i$ ?  $j$ ?

Feb 4, 2011

CSCI211 - Sprenkle

18

## Minimizing Lateness: Inversions

- **Claim.** Swapping two adjacent jobs with the same deadline does not increase the max lateness
- **Pf.** Let  $\ell$  be the lateness before the swap, and let  $\ell'$  be it afterwards
  - Lateness remains the same for all other jobs:
    - $\ell'_k = \ell_k$  for all  $k \neq i, j$
  - Lateness of  $i$  before is  $f_i - d_i = t_i + t_j - d_i$
  - Lateness of  $j$  after is  $f'_j - d_j = t_i + t_j - d_j$
  - But  $d_i = d_j$

Feb 4, 2011

CSCI211 - Sprenkle

19

## Minimizing Lateness: Inversions

- **Claim.** Swapping two adjacent, inverted jobs reduces the number of inversions by one and does *not increase the max lateness*
  - How do we know inversions are adjacent?
- **Pf Setup.** Let  $\ell$  be the lateness before the swap, and let  $\ell'$  be it afterwards
  - What can we say about how  $i$ 's,  $j$ 's, and other jobs' lateness changes?

By def of inversion,  $d_i < d_j$ 

Feb 4, 2011

CSCI211 - Sprenkle

20

## Minimizing Lateness: Inversions

- **Claim.** Swapping two adjacent, inverted jobs reduces the number of inversions by one and does *not increase the max lateness*.
- **Pf.** Let  $\ell$  be the lateness before the swap, and let  $\ell'$  be it afterwards
  - $\ell'_k = \ell_k$  for all  $k \neq i, j$
  - $\ell'_i \leq \ell_i$
  - If job  $j$  is late:
 

$$\begin{aligned} \ell'_j &= f'_j - d_j && \text{(definition)} \\ &= f_i - d_j && \text{(j finishes at time } f_i) \\ &\leq f_i - d_i && (i < j) \\ &\leq \ell_i && \text{(definition)} \end{aligned}$$

Feb 4, 2011

CSCI211 - Sprenkle

21

## Greedy Analysis Strategies

- **Greedy algorithm stays ahead.** Show that after each step of the greedy algorithm, its solution is at least as good as any other algorithm's.
- **Exchange argument.** Gradually transform any solution to the one found by the greedy algorithm without hurting its quality.
- **Structural.** Discover a simple "structural" bound asserting that every possible solution must have a certain value. Then show that your algorithm always achieves this bound.

Feb 4, 2011

CSCI211 - Sprenkle

22

## PS2

- Make clear the input to an algorithm
  - Don't want me guessing as to what you're doing because I might be wrong
- Always analyze the running time of your algorithms
  - Whether stated in problem or not
- Comparison of runtimes

Feb 4, 2011

CSCI211 - Sprenkle

23

## Assignments

- Exam 1
  - Open book, open notes, open lecture notes
  - **NO OTHER RESOURCES**
  - I mention explicitly to analyze your algorithms' running times. I will not do that in the future.

Feb 4, 2011

CSCI211 - Sprenkle

24

### Minimizing Lateness: Analysis of Greedy Algorithm

- **Theorem.** Greedy schedule  $S$  is optimal
- **Pf idea.** Convert Opt to Greedy
  - Does opt schedule have idle time?
  - What if opt schedule has no inversions?
  - What if opt schedule has inversions?

Feb 4, 2011

CSCI211 - Sprenkle

25

### Minimizing Lateness: Analysis of Greedy Algorithm

- **Theorem.** Greedy schedule  $S$  is optimal
- **Pf.** Define  $S^*$  to be an optimal schedule that has the fewest number of inversions, and let's see what happens
  - Can assume  $S^*$  has no idle time
  - If  $S^*$  has no inversions, then  $S = S^*$
  - If  $S^*$  has an inversion, let  $i-j$  be an adjacent inversion
    - Swapping  $i$  and  $j$  does not increase the maximum lateness and strictly decreases the number of inversions
    - This contradicts definition of  $S^*$

Feb 4, 2011

CSCI211 - Sprenkle

26

### Analyzing Running Time

- **Earliest deadline first.**

```

Sort n jobs by deadline so that  $d_1 \leq d_2 \leq \dots \leq d_n$ 
 $t = 0$ 
for  $j = 1$  to  $n$ 
  Assign job  $j$  to interval  $[t, t + t_j]$ 
   $s_j = t$ 
   $f_j = t + t_j$ 
   $t = t + t_j$ 
output intervals  $[s_j, f_j]$ 

```

 $O(n \log n)$ 

What is the runtime of this algorithm?

Feb 4, 2011

CSCI211 - Sprenkle

27

### Greedy Exchange Proofs

1. Label your algorithm's solution and a general solution.
  - Example: let  $A = \{a_1, a_2, \dots, a_n\}$  be the solution generated by your algorithm, and let  $O = \{o_1, o_2, \dots, o_n\}$  be an arbitrary (or optimal) feasible solution.
2. Compare greedy with other solution.
  - Assume that your arbitrary/optimal solution is not the same as your greedy solution (since otherwise, you are done).
  - Typically, can isolate a simple example of this difference, such as:
    - ① There is an element  $e \in O$  that  $\notin A$  and an element  $f \in A$  that  $\notin O$
    - ② 2 consecutive elements in  $O$  are in a different order than in  $A$  (i.e., there is an *inversion*).
3. Exchange.
  - Swap the elements in question in  $O$  (either ① swap one element out and another in or ② swap the order of the elements) and argue that solution is no worse than before.
  - Argue that if you continue swapping, you eliminate all differences between  $O$  and  $A$  in a *finite* # of steps without worsening the solution's quality.
  - Thus, the greedy solution produced is just as good as any optimal solution, and hence is optimal itself.
