## Review: Priority Queues for Sorting

1. Add elements into PQ with the number's value as its priority
2. Then extract the smallest number until done
  - Come out in sorted order

Sorting  $n$  numbers takes  $O(n \log n)$  time, which is our goal running time. However, "known" data structures won't give us that running time.

Already know our "loops" will be  $O(n)$

## Review: Heap Defined

- Combines benefits of sorted array and list
- Balanced binary tree

Note: **not** a binary search tree

3

## Review: Implementing a Heap

- Option 1: Use pointers
  - Each node keeps
    - Element it stores, key
    - 3 pointers: 2 children, parent
- Option 2: No pointers
  - Requires knowing upper bound on  $n$
  - For node at position  $i$ 
    - left child is at  $2i$
    - right child is at  $2i+1$

## Review: Heapify-Up

Heapify-up( $H, i$ ):

```

if  $i > 1$  then
   $j = \text{parent}(i) = \text{floor}(i/2)$ 
  if  $\text{key}[H[i]] < \text{key}[H[j]]$  then
    swap array entries  $H[i]$  and  $H[j]$ 
    Heapify-up( $H, j$ )
  
```

When is this algorithm used?  
What is the intuition?  
What is the run time?

## Deleting an Element

Jan 20, 2012

Sprengle - CSCI211

6

## Deleting an Element

- Delete at position  $i$
- Removing an element:
  - Messes up heap order
  - Leaves a "hole" in the heap
- Not as straightforward as Heapi fy-Up
- Algorithm
  1. Fill in element where hole was
    - Patch hole: move  $n^{\text{th}}$  element into  $i^{\text{th}}$  spot
  2. Adjust heap to be in order
    - At position  $i$  because moved  $n^{\text{th}}$  item up to  $i$

7

## Deleting an Element

- What are the possibilities when we move  $n^{\text{th}}$  element ( $w$ ) into spot where element was removed?

Jan 20, 2012

Sprengle - CSCI211

8

## Deleting an Element

Example of OK:  
11 deleted, replaced by 16

- Two "bad" possibilities: element  $w$  is
  - Too small: violation is between it and parent → Heapi fy-Up
  - Too big: with one or both children → Heapi fy-Down (example:  $w = 12$ )

9

## Deleting an Element

Example where new key is too small

- Delete 9
- Replace with 5

10

## Deleting an Element

Example where new key is too small

- Delete 9
- Replace with 5
- But  $5 < 6$ , so need to Heapi fy-Up

## Heapify-Down

```

Heapify-down(H, i):
  n = length(H)
  if 2i > n then           Why can we stop?
    Terminate with H unchanged
  else if 2i < n then
    left=2i and right=2i+1
    j be index that minimizes
      key[H[left]] and key[H[right]]
  else if 2i = n then
    j=2i
  if key[H[j]] < key[H[i]] then
    swap array entries H[i] and H[j]
    Heapify-down(H, j)
  
```

## Heapify-Down

```

Heapify-down(H, i):
  n = length(H)
  if 2i > n then           i is a leaf – nowhere to go
    Terminate with H unchanged
  else if 2i < n then
    left=2i and right=2i+1
    j be index that minimizes
      key[H[left]] and key[H[right]]
  else if 2i = n then
    j=2i

  if key[H[j]] < key[H[i]] then
    swap array entries H[i] and H[j]
    Heapify-down(H, j)

```

## Runtime of Heapify-Down?

```

Heapify-down(H, i):
  n = length(H)
  if 2i > n then
    Terminate with H unchanged
  else if 2i < n then
    left=2i and right=2i+1
    j be index that minimizes O(1)
      key[H[left]] and key[H[right]]
  else if 2i = n then
    j=2i

  if key[H[j]] < key[H[i]] then
    swap array entries H[i] and H[j] O(1)
    Heapify-down(H, j)

```

Num swaps:  $O(\log n)$

## Implementing Priority Queues with Heaps

Operation	Description	Run Time
StartHeap(N)	Creates an empty heap that can hold N elements	
Insert(v)	Inserts item v into heap	
FindMin()	Identifies minimum element in heap but does not remove it	
Delete(i)	Deletes element in heap at position i	
ExtractMin()	Identifies and deletes an element with minimum key from heap

## Putting It All Together...

1. Add elements into PQ with the number's value as its priority
2. Then extract the smallest number until done
  - Come out in sorted order

What is the running time of sorting numbers using a PQ implemented with a Heap?

$O(n \log n)$

## Additional Heap Operations

- Access elements in PQ by "name"

Key	2	4	5	6	9	20
Value	3542	5143	8712	1264	9123	5954

Priority  
Process id

- Maintain additional array **Position** that stores current position of each element in heap

- Operations:

- **Delete(Position[v])**
  - Does not increase overall running time
- **ChangeKey(v, α)**
  - Changes key of element v to α
  - Identify position of element v in array (Position array)
  - Change key, heapify

- $V$  = nodes (vertices)
- $E$  = edges between pairs of nodes
- Captures pairwise relationship between objects
- Graph size parameters:  $n = |V|$ ,  $m = |E|$

$V = \{1, 2, 3, 4, 5, 6, 7, 8\}$   
 $E = \{1-2, 1-3, 2-3, 2-4, 2-5, 3-5, 3-7, 3-8, 4-5, 5-6\}$   
 $n = 8$   
 $m = 11$
