

Objective

- More for loop
- Designing for Change
- Using Functions

Lab Review

- Follow examples
 - Find solutions to similar problems
 - Understand the solution
 - Adapt the solution to your problem

| Task | Objective |
|------------------------|---|
| Creating a Text object | Confirming that you know how to use the API, using a class that you hadn't used previously. |
| Making a picture | Allow you to show creativity |

Recommendations

- Review the slides, example programs, and/or text book every day to review what we discussed
 - This problem made sense in class... Does it still make sense?
- Practice a problem every day
 - I rarely use problems from the text book so they're good practice
- Ask questions
- “sense of accomplishment after lab”

Sept 27, 2017

3

Review

- Which lab are we working on?
 - How many have you completed?
- What statement do we use to repeat something?
- What are the possible ways to use the `range` function?
 - What do they mean?

Sept 27, 2017

Sprenkle - CSCI111

4

Practicing **for** Loops

What is getting repeated?
How many times?

➤ A) 1

2

3

4

Tell me that you
love me more

➤ C) 10

9

8

7

...

1

Blast off!

➤ B) I had the time of my life
And I never felt this way before
And I swear this is true
And I owe it all to you

} 3 times,
followed by Dirty bit

Sept 27, 2017

Sprenkle - CSCI111

5

Programming Practice

- Add 5 numbers, inputted by the user
 - After implementing, simulate running on computer
- How would have implemented this last week?
 - How can we improve that based on our new knowledge?

Sept 27, 2017

Sprenkle - CSCI111

`sum5.py`

6

Generalizing Solution: Accumulator Design Pattern

1. Initialize accumulator variable
2. Loop until done
 - Update the value of the accumulator
3. Display result

Sept 27, 2017

Sprenkle - CSCI111

7

Programming Practice at Home

- Average 5 numbers inputted by the user
- Good example of how to build up to a solution
 - Break down into smaller pieces

Sept 27, 2017

Sprenkle - CSCI111

8

DESIGNING FOR CHANGE

Sept 27, 2017

Sprenkle - CSCI111

9

Designing for Change

- What are we likely to change in the program?
- How can we make the program easier to change?

Sept 27, 2017

Sprenkle - CSCI111

10

Constants

- Special variables whose values are defined once and never changed
 - By convention, not enforced by interpreter
- By convention
 - A constant's name is all caps
 - Typically defined at top of program → easy to find, change
- Examples:

```
NUM_INPUT = 5  
MIN_VALUE = 0
```

Never assigned values in remainder of program

Sept 27, 2017

Sprenkle - CSCI111

11

Programming Practice

- Sum x numbers inputted by the user

`sum_with_constant.py`

Sprenkle - CSCI111

12

Parts of an Algorithm

- Input, Output
- Primitive operations
 - What data you have, what you can do to the data
- Naming
 - Identify things we're using
- Sequence of operations
- Conditionals
 - Handle special cases
- Repetition/Loops
- Subroutines
 - **Call**, reuse similar techniques

Sept 27, 2017

Sprenkle - CSCI111

13

Motivating Functions

- PB&J: spreading PB, spreading jelly
 - Similar processes
 - Want to do many times
 - Simplify by saying “spread” rather than saying “move the knife back and forth, condiment side down, against the bread until you get X inches of ...”
- Benefits
 - Reuse, reduce code
 - Easier to read, write

Sept 27, 2017

Sprenkle - CSCI111

14

Example

- How would you find the area of this shape?

Sept 27, 2017

Sprenkle - CSCI111

15

Example

- How would you find the area of this shape?
- Algorithm Possibilities:
 - Total Area = $\frac{1}{2} b_t h_t + w_r * h_r$
 - Total Area = Area of triangle + Area of rectangle

Which algorithm is easier to understand?

For (most) humans,
words and abstraction of ideas
are easier to understand

Sept 27, 2017

Sprenkle - CSCI111

16

Functions

- Functions perform some task
 - May take **arguments/parameters**
 - May **return** a value that can be used in assignment

We don't know **how** it does it,
but it's okay because it doesn't matter
→as long as it **works!**

Sept 27, 2017

Sprenkle - CSCI111

17

Functions

Argument list (input)

- Syntax:
 - `func_name(arg0, arg1, ..., argn)`
- Depending on the function, arguments may or may not be required
 - `[]` indicate an optional argument
- Semantics: depend on the function

Sept 27, 2017

Sprenkle - CSCI111

18

Built-in Functions

- Python provides some built-in functions for common tasks

Known as function's **signature**

Template for how to "call" function

Optional argument

- **input**([prompt])

- If prompt is given as an argument, prints the prompt without a newline/carriage return
- If no prompt, just waits for user's input
- **Returns** user's input (up to "enter") as a **string**

Sept 27, 2017

Sprenkle - CSCI111

19

Description of print

- **print**(value, ..., sep=' ', end='\n', file=sys.stdout) Important later

Meaning: default values for sep and end are ' ' and '\n', respectively

- Print *object*(s) to the stream *file*, separated by *sep* and followed by *end*.
- Both *sep* and *end* must be strings; they can also be **None**, which means to use the default values. If no *object* is given, *print*() will just write *end*.

<http://docs.python.org/py3k/library/functions.html#print>

Sept 27, 2017

Description of print

- `print(value, ..., sep=' ', end='\n', file=sys.stdout)` Important later

Meaning: default values for `sep` and `end` are ' ' and '\n', respectively

- Examples

```
print("Hi", "there", "class", sep='; ')
print("Put on same", end='')
print("line")
```

Output: `Hi; there; class`
`Put on sameline`

Sept 27, 2017

Sprenkle - CSCI111

`print_examples.py` 21

More Examples of Built-in Functions

| Function Signature | Description |
|----------------------------|---|
| <code>round(x[, n])</code> | Return the <code>float</code> <code>x</code> rounded to <code>n</code> digits after the decimal point If no <code>n</code> , round to nearest <code>int</code> |
| <code>abs(x)</code> | Returns the absolute value of <code>x</code> |
| <code>type(x)</code> | Return the type of <code>x</code> |
| <code>pow(x, y)</code> | Returns <code>x^y</code> |

Interpreter

Sept 27, 2017

Sprenkle - CSCI111

22

Using Functions

- Example use: Alternative to exponentiation
 - Objective: compute -3^2
 - Python alternatives:
 - `pow(-3, 2)`
 - `(-3) ** 2`
- We often use functions in assignment statements
 - Function does something
 - Save the output of function (what is *returned* in a variable)

```
roundedX = round(x)
```
