Objectives

A new data type: Lists

Reminders:

- You can and should practice programming regularly
- Use http://pythontutor.com/
 - Draw pictures!
- You can install Python3 on your own computer, if it's not already

Oct 30, 2017 Sprenkle - CSCl111 1

Review

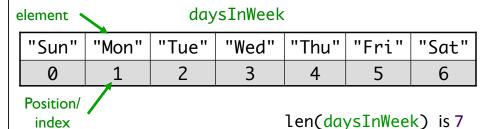

- How can we convert between characters and their numerical representation?
 - How can we convert from the numerical representation to the character?
- What are the various things we can do with strings?

Sequences of Data

- Sequences so far ...
 - > str: sequence of characters
 - > range: generator (sequence of numbers)
- We commonly group a sequence of data together and refer to them by one name
 - Days of the week: Sunday, Monday, Tuesday, ...
 - Months of the year: Jan, Feb, Mar, ...
 - ➤ Shopping list
- Can represent this data as a list in Python
 - > Similar to arrays in other languages

Oct 30, 2017 Sprenkle - CSCI111 3

Lists: A Sequence of Data Elements

in the list

-

• Elements in lists can be any data type

What does does this look similar to, in structure?

Benefits of Lists

- Group related items together
 - Instead of creating separate variables
 - sunday = "Sun"
 - monday = "Mon"
- Convenient for dealing with large amounts of data
 - Example: could keep all the temperature data in a list if needed to reuse later
- Functions and methods for handling, manipulating lists

List Operations

Similar to operations for strings

Concatenation	<seq> + <seq></seq></seq>		
Repetition	<seq> * <int-expr></int-expr></seq>		
Indexing	<seq>[<int-expr>]</int-expr></seq>		
Length	len(<seq>)</seq>		
Slicing	<seq>[:]</seq>		
Iteration	for <var> in <seq>:</seq></var>		
Membership	<expr> in <seq></seq></expr>

Lists: A Sequence of Data Elements

element daysInWeek

"Sun"	"Mon"	"Tue"	"Wed"	"Thu"	"Fri"	"Sat"
0	1	2	3	4	5	6

Position in the list

len(daysInWeek) is 7

8

- -<listname>[<int_expr>]
 - > Similar to accessing characters in a string
 - > daysInWeek[-1] is "Sat"
 - > daysInWeek[0] is "Sun"

Iterating through a List

- Read as
 - > For every element in the list ...

Output equivalent to

```
for x in range(len(list)):
    print(list[x])

Iterates through
    positions in list
```

Sprenkle - CSCI111 daysOfWeek.py

9

Example Code

friends.py

Practice

 Get the *list* of weekend days from the days of the week list

```
> daysInWeek=["Sun", "Mon", "Tue",
    "Wed", "Thu", "Fri", "Sat"]
```

Oct 30, 2017 Sprenkle - CSCI111

11

which is a Str 12

Practice

Oct 30, 2017

 Get the *list* of weekend days from the days of the week list

Sprenkle - CSCI111

6

Membership

- Check if a list contains an element
- Example usage
 - > enrolledstudents is a list of students who are enrolled in the class
 - Want to check if a student who attends the class is enrolled in the class

```
if student not in enrolledstudents:
    print(student, "is not enrolled")
```

Making Lists of Integers Quickly

- If you want to make a list of integers that are evenly spaced, you can use the range generator
- Example: to make a list of the even numbers from 0 to 99:

```
PevenNumList = list(range(0, 99, 2))
Converts the generated
numbers into a list
```

Feb 27, 2017 Sprenkle - CSCI111 14

str Method Flashback

- •string.split([sep])
 - Returns a list of the words in the string String, using Sep as the delimiter string
 - ➤ If Sep is not specified or is None, any whitespace (space, new line, tab, etc.) is a separator
 - > Example:

```
phrase = "Hello, Computational Thinkers!"
x = phrase.split()
```

What is X? Its data type? What does X contain?

Feb 27, 2017 Sprenkle - CSCI111 15

str Method Flashback

- •string.join(iterable)
 - Return a string which is the concatenation of the strings in the iterable/sequence. The separator between elements is String.
 - Example:

```
x = ["1","2","3"]
phrase = " ".join(x)
```

What is X's data type?
What is phrase's data type?
What does phrase contain?

List Methods

Method Name	Functionality		
<pre><list>.append(x)</list></pre>	Add element x to the end		
<pre><list>.sort()</list></pre>	Sort the list		
<pre><list>.reverse()</list></pre>	Reverse the list		
<pre><list>.index(x)</list></pre>	Returns the index of the first occurrence of x , Error if x is not in the list		
<pre><list>.insert(i, x)</list></pre>	Insert x into list at index i		
<pre><list>.count(x)</list></pre>	Returns the number of occurrences of <i>x</i> in list		
<pre><list>.remove(x)</list></pre>	Deletes the first occurrence of <i>x</i> in list		
<pre><list>.pop(i)</list></pre>	Deletes the <i>i</i> th element of the list and returns its value		

Note: methods do **not** return a copy of the list ...

Lists vs. Strings

- Strings are immutable
 - Can't be mutated?
 - Err, can't be modified/ changed
- Lists are mutable
 - Can be changed
 - Called "change in place"
 - Changes how we call/use methods

Practice in Interactive Mode

- list = [7,8,9]
- string = "abc"
- list[1]
- string[1]
- string.upper()
- list.reverse()
- string
- list
- string = string.upper()
- list = list.reverse()
- string
- list

Sprenkle - CSCI111

19

Special Value: None

- Special value we can use
 - ➤ E.g., Return value from function/method when there is an error
 - Or if function/method does not return anything (Similar to null in Java)
- If you execute

```
list = list.sort()
print(list)
```

Prints None because list.sort() does not return anything

20

Fibonacci Sequence

- Goal: Solve using list
- $F_0 = F_1 = 1$
- $F_n = F_{n-1} + F_{n-2}$
- Example sequence: 1, 1, 2, 3, 5, 8, 13, 21, ...
