

Objectives

- Defining our own classes

March 19, 2018

Sprenkle - CSCI111

1

Review: Dictionaries

- What is a dictionary in Python?
- What is the syntax for creating a new dictionary?
- How do we access a key's value from a dictionary?
 - What happens if there is no mapping for that key?
- How do we create a key → value mapping in a dictionary?
- How can we iterate through a dictionary?

March 19, 2018

Sprenkle - CSCI111

2

ABSTRACTIONS

March 19, 2018

Sprenkle - CSCI111

3

Abstractions

- Provide ways to think about program and its data
 - Get the jist without the details
- Examples we've seen
 - Functions and methods `encodeFile(filename, key)`
 - Used to perform some operation but we don't need to know how they're implemented
 - Dictionaries
 - Know they map keys to values
 - Don't need to know how the keys are organized/stored in the computer's memory
 - Just about everything we do in this class...

March 19, 2018

Sprenkle - CSCI111

4

Classes and Objects

- Provide an abstraction for how to organize and reason about data
- Example: `GraphWin` class
 - Had **attributes** (i.e., data or state) background color, width, height, and title
 - Each `GraphWin` object had these attributes
 - Each `GraphWin` object had its own values for these attributes
 - Used methods (API) to modify the object's state, get information about attributes

March 19, 2018

Sprenkle - CSCI111

5

Defining Our Own Classes

- Often, we want to represent data or information that we do **not** have a way to represent using *built-in types or libraries*
- Classes provide way to *organize and manipulate* data
 - Organize: data structures used
 - E.g., ints, lists, dictionaries, other objects, etc.
 - Manipulate: methods

March 19, 2018

Sprenkle - CSCI111

6

What is a Class?

- Defines a new **data type**
- Defines the class's **attributes** (i.e., data or state) and **methods**
 - Methods are like **functions** **within** a class and are the class's **API**

Internal **data**
hidden from
others

Object o of
type
Classname

Other objects
manipulate using
methods

March 19, 2018

Sprenkle - CSCI111

7

Defining a Card Class

- Create a class that represents a playing card
 - How can we represent a playing card?
 - What information do we need to represent a playing card?

March 19, 2018

Sprenkle - CSCI111

8

Representing a Card object

- Every card has two attributes:
 - Suite (one of “hearts”, “diamonds”, “clubs”, “spades”)
 - Rank
 - 2-10: numbered cards
 - 11: Jack
 - 12: Queen
 - 13: King
 - 14: Ace

March 19, 2018

Sprenkle - CSCI111

9

Defining a New Class

- Syntax:

March 19, 2018

Sprenkle - CSCI111

10

Card Class (Incomplete)

Doc String

```
class Card:
    """ A class to represent a standard playing card.
        The ranks are ints: 2-10 for numbered cards, 11=Jack,
        12=Queen, 13=King, 14=Ace.
        The suits are strings: 'clubs', 'spades', 'hearts',
        'diamonds'."""
    def __init__(self, rank, suit):
        """Constructor for class Card takes int rank and
           string suit."""
        self._rank = rank
        self._suit = suit

    def getRank(self):
        "Returns the card's rank."
        return self._rank

    def getSuit(self):
        "Returns the card's suit."
        return self._suit
```

Methods

March 19, 2018 Sprenkle - CSCI111 card.py 11

Card Class (Incomplete)

Doc String

```
class Card:
    """ A class to represent a standard playing card.
        The ranks are ints: 2-10 for numbered cards, 11=Jack,
        12=Queen, 13=King, 14=Ace.
        The suits are strings: 'clubs', 'spades', 'hearts',
        'diamonds'."""
    def __init__(self, rank, suit):
        """Constructor for class Card takes int rank and
           string suit."""
        self._rank = rank
        self._suit = suit

    def getRank(self):
        "Returns the card's rank."
        return self._rank

    def getSuit(self):
        "Returns the card's suit."
        return self._suit
```

Methods

Methods are like *functions* defined in a class

March 19, 2018 Sprenkle - CSCI111 card.py 12

Defining the Constructor

- `__init__` method is like the **constructor**
 - In constructor, define **instance variables**
 - **Data** contained in every object
 - Also called **attributes** or **fields**
 - Constructor **never returns** anything
- First parameter of every method is **self**
- pointer to the object that method acts on

Convention:
named with `_`

```
def __init__(self, rank, suit):  
    """Constructor for class Card takes int rank  
    and string suit."""  
    self._rank = rank  
    self._suit = suit
```

Instance variables

March 19, 2018

Sprenkle - CSCI111

13

Review

- How do we use the constructor for an object?

March 19, 2018

Sprenkle - CSCI111

14

Using the Constructor

```
def __init__(self, rank, suit):
```

- As defined, constructor is called using **Card(<rank>, <suit>)**
 - Do not *pass* anything for the **self** parameter
 - Python handles for us
 - Passes the parameter *automatically*

Object **card**
of type Card

```
_rank = ?  
_suit = ?
```

March 19, 2018

Sprenkle - CSCI111

15

Using the Constructor

```
def __init__(self,  
rank, suit):
```

- As defined, constructor is called using **Card(<rank>, <suit>)**
 - Do not *pass* anything for the **self** parameter
 - Python handles, passing the parameter for us *automatically*
- Example:
 - **card = Card(2, "hearts")**
 - Creates a 2 of Hearts card
 - Python passes **card** as **self** for us

Object **card**
of type Card

```
_rank = 2  
_suit = "hearts"
```

March 19, 2018

Sprenkle - CSCI111

16

Review

- How do we call a method on an object?

March 19, 2018

Sprenkle - CSCI111

17

Accessor Methods

- Need to be able to get information about the object

- Have **self** parameter
- Return data/information

```
def getRank(self):  
    "Returns the card's rank."  
    return self._rank
```

```
def getSuit(self):  
    "Returns the card's suit."  
    return self._suit
```

```
card = Card(..., ...)
```

- These methods will get called as **card.getRank()** and **card.getSuit()**
 - Python plugs **card** in for **self**

March 19, 2018

Sprenkle - CSCI111

18

Another Special Method: `__str__`

- Returns a *string* that describes the object
- Whenever you **print** an object, Python checks if the object's `__str__` method is defined
 - Prints result of calling `__str__` method
- `str(<object>)` also calls `__str__` method

```
def __str__(self):  
    """Returns a string  
    describing the card as 'rank of  
    suit'."""  
    result = ""  
    if self._rank == 11:  
        result += "Jack"  
    elif self._rank == 12:  
        result += "Queen"  
    elif self._rank == 13:  
        result += "King"  
    elif self._rank == 14:  
        result += "Ace"  
    else:  
        result += str(self._rank)  
    result += " of " + self._suit  
    return result
```

March 19, 2018

Sprenkle - CSCI111

19

Using the Card Class

Invokes the
`__str__` method

```
def main():  
    c1 = Card(14, "spades")  
    print(c1)  
    c2 = Card(2, "hearts")  
    print(c2)
```

Displays:

Ace of spades
2 of hearts

Object **c1** of
type Card

`_rank = 14`
`_suit = "spades"`

Object **c2** of
type Card

`_rank = 2`
`_suit = "hearts"`

March 19, 2018

Sprenkle - CSCI111

20

Example: Card Color

- **Problem:** Add a method to the `Card` class called `getCardColor` that returns the card's suit's color ("red" or "black")
- **Procedure** for defining a method (similar to functions)
 - What is the input?
 - What is the output?
 - What is the method signature/header?
 - What does the method do?
- How do we call the method?

March 16, 2018

Sprenkle - CSCI111

`card2.py`

21

Example: Rummy Value

- **Problem:** Add a method to the `Card` class called `getRummyValue` that returns the value of the card in the game of Rummy
- **Procedure** for defining a method (similar to functions)
 - What is the input?
 - What is the output?
 - What is the method signature/header?
 - What does the method do?
- How do we call the method?

March 19, 2018

Sprenkle - CSCI111

`card2.py`

22

Card API

- Based on what we've seen/done so far, what does the `Card` class's API look like?

March 19, 2018

Sprenkle - CSCI111

23

Card API

Implementation of methods is hidden

- `Card(<rank>, <suit>)`
- `getRank()`
- `getSuit()`
- `getRummyValue()`
- `__str__()`

March 19, 2018

Sprenkle - CSCI111

24

Defining a Card Class

(not covered in class)

- Create a class that represents a playing card
 - How can we represent a playing card?
 - What information do we need to represent a playing card?
- Do we **need** a class to represent a card?
 - Does any built-in data type naturally represent a card?
 - What are the tradeoffs to those approaches?

March 19, 2018

Sprenkle - CSCI111

25

Using the Card class

- Having the `Card` class means that we can represent a `Card` in code

Now that we have the `Card` class,
how can we **use** it?

March 19, 2018

Sprenkle - CSCI111

26

Using the Card class

Now that we have the Card class,
how can we **use** it?

- Let's write a simplified version of the game of War
 - Basically just part of a round
- What are the rules of a round of War?

March 19, 2018

Sprenkle - CSCI111

war.py

27

Review

```
from graphics import *  
  
win = GraphWin("Picture")  
win.setBackground("black")
```

```
from card import *  
  
c = Card(7, "diamonds")  
print(c.getRank())
```

- Same programming as before
- Just defining our own classes

March 19, 2018

Sprenkle - CSCI111

28

Using the Card class

Now that we have the Card class,
how can we **use** it?

- Can make a **Deck** class
 - What data should a Deck contain?
 - How can we represent that data?
- To start: write methods `__init__` and `__str__`
 - What do the method headers look like?

March 19, 2018

Sprenkle - CSCI111

29

Looking Ahead

- Prelab 9 for tomorrow
 - Engaged in the object-oriented reading
- Lab 9 due Friday
- Exam Friday
 - Discussion on Wednesday

March 19, 2018

Sprenkle - CSCI111

30
