

Objectives

- A new data type: Lists

1

Lab 7 Retrospective

- Things we learned in the past keep coming back!
 - Combining with the new things!

- That's the power of computing/programming!

2

Review

Lab was yesterday, so won't review in class
Here for reference when you review later

- How do you format strings?
 - What does a format specifier look like?
 - What questions should you ask when formatting strings/creating the format specifier?
- How can we find the ASCII value for a character?
- How can we find the character associated with an ASCII value?

March 9, 2022

Sprengle - CSCI111

3

3

Sequences of Data

- Sequences so far ...
 - `str`: sequence of characters
 - `range`: generator (sequence of numbers)
- We commonly group a sequence of data together and refer to them by one name
 - Days of the week: Sunday, Monday, Tuesday, ...
 - Months of the year: Jan, Feb, Mar, ...
 - Shopping list
- Can represent this data as a **list** in Python
 - Similar to **arrays** in other languages

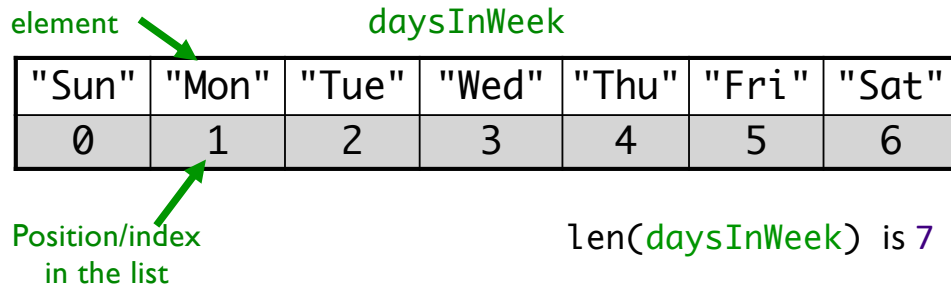

March 9, 2022

Sprengle - CSCI111

4

4

Lists: A *Sequence* of Data Elements

- Elements in lists can be *any* data type

What does this look similar to, in structure?

March 9, 2022

Sprenkle - CSC111

5

5

Example Lists in Python

- Empty List: `[]`
- List of `str`s:
 - `daysInWeek=["Sun", "Mon", "Tue", "Wed", "Thu", "Fri", "Sat"]`
- List of `float`s
 - `highTemps=[60.4, 70.2, 63.8, 55.7, 54.2]`
- Lists can contain `>1` type
 - `wheelOfFortune=[250, 1000, "Bankrupt", "Free Play"]`

Syntax for list: `[]`
How different from accessing a character in a string?

March 9, 2022

6

6

Benefits of Lists

- Group related items together
 - Instead of creating separate variables
 - `sunday = "Sun"`
 - `monday = "Mon"`
- Convenient for dealing with large amounts of data
 - Example: could keep all the temperature data in a list if needed to reuse later
- Functions and methods for handling, manipulating lists

March 9, 2022

Sprenkle - CSCI111

7

7

List Operations

Similar to operations for strings

Concatenation	<code><seq> + <seq></code>
Repetition	<code><seq> * <int-expr></code>
Indexing	<code><seq>[<int-expr>]</code>
Length	<code>len(<seq>)</code>
Slicing	<code><seq>[:]</code>
Iteration	<code>for <var> in <seq>:</code>
Membership	<code><expr> in <seq></code>

March 9, 2022

Sprenkle - CSCI111

8

8

Lists: A Sequence of Data Elements

element →

daysInWeek

"Sun"	"Mon"	"Tue"	"Wed"	"Thu"	"Fri"	"Sat"
0	1	2	3	4	5	6

Position in the list →

len(daysInWeek) is 7

- `<listname>[<int_expr>]`
 - Similar to accessing characters in a string
 - `daysInWeek[-1]` is "Sat"
 - `daysInWeek[0]` is "Sun"

March 9, 2022

Sprenkle - CSCI111

9

9

Iterating through a List

- Read as
 - For every element in the list ...

An item in the list →

```
for item in list:  
    print(item)
```

list object →

Iterates through items in list

- Output equivalent to

```
for x in range(len(list)):  
    print(list[x])
```

Iterates through positions in list

March 9, 2022

Sprenkle - CSCI111 `daysOfWeek.py`

10

10

Example Code

```
friends = ["Alice", "Bjorn", "Casey", "Duane", "Elsa", "Farrah"]

for name in friends:
    print("I know " + name + ".")
    print(name, "is a friend of mine.")

print("Those are the people I know.")
```

friends.py

March 9, 2022

Sprenkle - CSCI111

11

11

Example Code

```
friends = ["Alice", "Bjorn", "Casey", "Duane", "Elsa", "Farrah"]

for name in friends:
    print("I know " + name + ".")
    print(name, "is a friend of mine.")

print("Those are the people I know.")
```

Practice on your own: Rewrite as an “iterate over positions in list” loop

March 9, 2022

Sprenkle - CSCI111

friends.py

12

12

Complete Old MacDonald

```
animals = ["cow", "pig", "duck"]
sounds = ["moo", "oink", "quack"]

for i in range(len(animals)):

    printVerse(
```

Doc String:

```
printVerse(animal, sound)
    Prints a verse of Old MacDonald, plugging in the animal
    and sound parameters (which are strings), as appropriate.
```

March 9, 2022

Sprenkle - CSCI111

oldmac.py

13

13

Practice

- Get the *list* of weekend days from the days of the week list

```
➤ daysInWeek=["Sun", "Mon", "Tue",
              "Wed", "Thu", "Fri", "Sat"]
```

March 9, 2022

Sprenkle - CSCI111

14

14

Practice

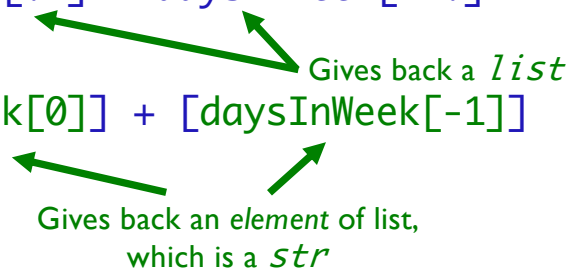

- Get the *list* of weekend days from the days of the week list

➤ `daysInWeek=["Sun", "Mon", "Tue", "Wed", "Thu", "Fri", "Sat"]`

➤ `weekend = daysInWeek[:1] + daysInWeek[-1:]`

or

➤ `weekend = [daysInWeek[0]] + [daysInWeek[-1]]`

March 9, 2022

Sprenkle - CSCI111

15

15

Membership

- **Check if a list contains an element**

- Example usage

➤ **enrolledstudents** is a list of students who are enrolled in the class

➤ Want to check if a student who attends the class is enrolled in the class

```
if student not in enrolledstudents:  
    print(student, "is not enrolled")
```

March 9, 2022

Sprenkle - CSCI111

16

16

Making Lists of Integers Quickly

- If you want to make a list of integers that are evenly spaced, you can use the **range** generator
- Example: to make a list of the even numbers from 0 to 99:

➤ `evenNumList = list(range(0, 99, 2))`

 **Converts** the generated numbers into a list

March 9, 2022

Sprenkle - CSCI111

17

17

str Method Flashback

• `string.split([sep])`

- Returns a **list** of the words in the string `string`, using `sep` as the delimiter string
- If `sep` is not specified or is `None`, any *whitespace* (space, new line, tab, etc.) is a separator

➤ Example:

```
phrase = "Hello, Computational Thinkers!"  
x = phrase.split()
```

What is x? What is its data type? What does X contain?

March 9, 2022

Sprenkle - CSCI111

18

18

str Method Flashback

● string.join(iterable)

➤ Return a string which is the concatenation of the *strings* in the **iterable**/sequence. The separator between elements is **string**.

➤ Example:

```
x = ["1", "2", "3"]  
phrase = " ".join(x)
```

What is *x*'s data type?
What is *phrase*'s data type?
What does *phrase* contain?

March 9, 2022

19

19

List Methods

Method Name	Functionality
<code><list>.append(<i>x</i>)</code>	Add element <i>x</i> to the end
<code><list>.sort()</code>	Sort the list
<code><list>.reverse()</code>	Reverse the list
<code><list>.index(<i>x</i>)</code>	Returns the index of the first occurrence of <i>x</i> , Error if <i>x</i> is not in the list
<code><list>.insert(<i>i</i>, <i>x</i>)</code>	Insert <i>x</i> into list at index <i>i</i>
<code><list>.count(<i>x</i>)</code>	Returns the number of occurrences of <i>x</i> in list
<code><list>.remove(<i>x</i>)</code>	Deletes the first occurrence of <i>x</i> in list
<code><list>.pop(<i>i</i>)</code>	Deletes the <i>i</i> th element of the list and returns its value

Note: methods do **not return a copy** of the list ...

March 9, 2022

Sprenkle - CSCI111

20

20

Lists vs. Strings

- Strings are **immutable**
 - Can't be mutated?
 - Err, can't be modified/changed
- Lists are **mutable**
 - Can be changed
 - Called "change in place"
 - Changes how we call/use methods

```
groceryList=["milk", "eggs", "bread", "Doritos", "OJ", "sugar"]
```

```
groceryList[0] = "skim milk"  
groceryList[3] = "popcorn"
```

```
groceryList is now ["skim milk", "eggs", "bread", "popcorn", "OJ", "sugar"]
```

March 9, 2022

Sprenkle - CSCI111

21

21

Practice in Interactive Mode

- list = [7,8,9]
- string = "abc"
- list[1]
- string[1]
- string.upper()
- list.reverse()
- string
- list
- string = string.upper()
- list = list.reverse()
- string
- list

March 9, 2022

Sprenkle - CSCI111

22

22

Special Value: **None**

(Similar to **null** in Java)

- Special value we can use
 - E.g., Return value from function/method when there is an error
 - Or if function/method does not return anything
- If you execute

```
list = list.sort()
print(list)
```

 - Prints **None** because `list.sort()` does **not return** anything

March 9, 2022

Sprenkle - CSC111

What should we code instead?

23

Returning to the Fibonacci Sequence

- Goal: Solve using list
- $F_0=0, F_1=1$
- $F_n=F_{n-1} + F_{n-2}$
- Example sequence: 1, 1, 2, 3, 5, 8, 13, 21, ...

24

Fibonacci Sequence

- Create a list of the 1st 20 Fibonacci numbers

➤ $F_0=0; F_1=1; F_n=F_{n-1}+F_{n-2}$

Grow list as we go

```
fibs = []           # create an empty list
fibs.append(0)     # append the first two Fib numbers
fibs.append(1)
```

March 9, 2022

Sprenkle - CSCI111

fibs.py

25

25

Fibonacci Sequence

- Create a list of the 1st 20 Fibonacci numbers

➤ $F_0=0; F_1=1; F_n=F_{n-1}+F_{n-2}$

Grow list as we go

```
fibs = []           # create an empty list
fibs.append(0)     # append the first two Fib numbers
fibs.append(1)
for x in range(2, 20): # compute the next 18 numbers
    newfib = fibs[x-1] + fibs[x-2]
    fibs.append(newfib) # add next number to the list

print(fibs)       # print out the list as a list in one line
```

March 9, 2022

Sprenkle - CSCI111

fibs.py

26

26

Fibonacci Sequence

- Create a list of the 1st 20 Fibonacci numbers

➤ $F_0=0; F_1=1; F_n=F_{n-1}+F_{n-2}$

```
fibs = []           # create an empty list
fibs.append(0)     # append the first two Fib numbers
fibs.append(1)
for x in range(2, 20): # compute the next 18 numbers
    newfib = fibs[-1] + fibs[-2] # Alternative
    fibs.append(newfib) # add next number to the list

print(fibs) # print out the list as a list in one line
```

March 9, 2022

Sprenkle - CSCI111

`fibs.py`

27

27

Lists vs. Arrays

- Briefly, lists are similar to arrays in other languages
 - More similar to *Vectors* in C++ and *ArrayLists* in Java
- Typically, arrays have **fixed** lengths
 - Can't insert and remove elements from arrays so that the length of the array changes
 - Need to make the array as big as you'll think you'll need

Sprenkle - CSCI111

28

28

Fibonacci Sequence: Array-like Implementation

- Create a list of the 1st 20 Fibonacci numbers

➤ $F_0 = F_1 = 1; F_n = F_{n-1} + F_{n-2}$

- Create whole list
- Update values

```
fibs = [0]*20      # creates a list of size 20,  
                  # containing all 0s  
fibs[0] = 0  
fibs[1] = 1
```

March 9, 2022

Sprenkle - CSCI111

fibs2.py

29

29

Fibonacci Sequence: Array-like implementation

- Create a list of the 1st 20 Fibonacci numbers

➤ $F_0 = F_1 = 1; F_n = F_{n-1} + F_{n-2}$

- Create whole list
- Update values

```
fibs = [0]*20      # creates a list of size 20,  
                  # containing all 0s  
fibs[0] = 0  
fibs[1] = 1  
  
for x in range(2, len(fibs)):  
    newfib = fibs[x-1] + fibs[x-2]  
    fibs[x] = newfib  
  
for num in fibs:      # print each num on sep line  
    print(num)
```

Looking Ahead

- Lab 7 – due Friday
- Broader Issue: tabling until next week
