

Objectives

- More Java fundamentals
 - `java.lang` classes: `Math` and `String` class
 - Control Structures
 - Arrays

Sept 14, 2016

Sprenkle - CSCI209

1

Review: Python Transition **Warning**

You cannot **redeclare** a variable name in the same scope

- OK:

```
int x = 3;  
x = -3;
```

- Not OK:

```
int x = 3;  
int x = -3;  
...  
boolean x = true;
```

Compiler errors

2

INTRO TO JAVA LIBRARIES

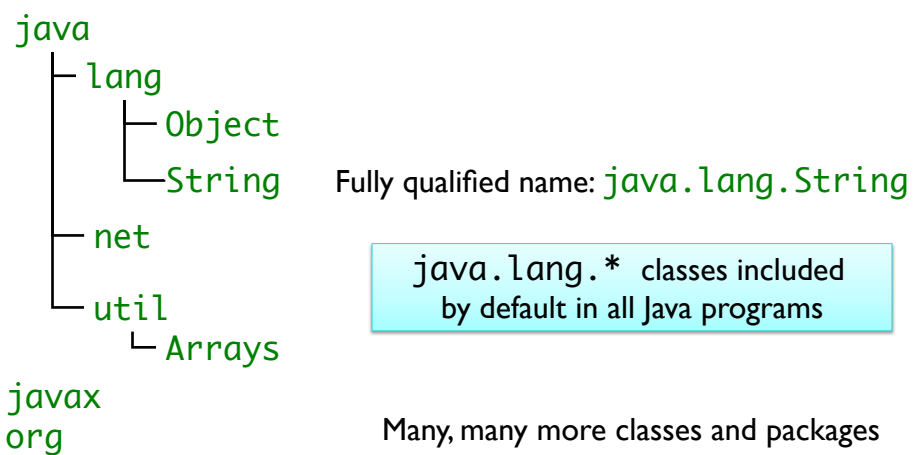

Sept 14, 2016

Sprenkle - CSCI209

3

Java Libraries

- Organized into a hierarchy of *packages*

Sept 14, 2016

Sprenkle - CSCI209

4

Java API Documentation

- **API:** Application Programming Interface
 - What the class can do for YOU!
 - Complete documentation of every class included with the JDK
 - Every method and variable contained in class
- <http://docs.oracle.com/javase/8/docs/api>
- Bookmark it!
 - Too many classes, methods to remember them all
 - Refer to it often

Sept 14, 2016

Sprenkle - CSCI209

5

`java.lang.Math` class

- Similar to Python's `math` module
 - **Included by default** in every Java program
 - Contains useful mathematical functions (methods) and constants (fields):
-
- Look at `java.lang.Math` API online
 - <http://docs.oracle.com/javase/8/docs/api/>
 - Note how API is specified

Sept 14, 2016

Sprenkle - CSCI209

6

java.lang.Math class

- Example Uses:

```

double y = Math.pow(x, a);
double z = Math.sin(y);
double d = Math.exp(4.59) * Math.PI;
  
```

method

constant

Use `Classname.methodname()` to call
Math's methods because they're **static**
static: for the class

MathExample.java

Sept 14, 2016

Sprenkle - CSCI209

7

java.lang.String class

- Similar functionality to Python but different ways to use
- Strings are represented by **double** quotes: `""`
 - Single quotes represent **chars** only
- Examples:

```

String emptyString = "";
String niceGreeting = "Hello there.";
String badGreeting = "What do you want?";
  
```

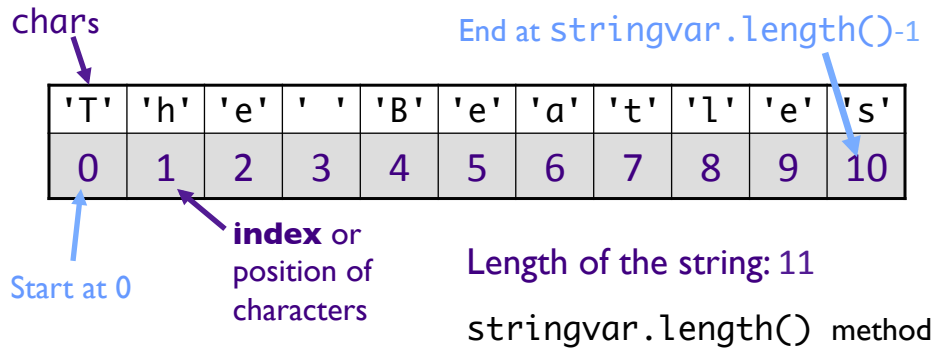

Sept 14, 2016

Sprenkle - CSCI209

8

Strings

- A **char** at each position of String
`stringvar = "The Beatles";`

Use `charAt` method to access chars

Sept 14, 2016

Sprenkle - CSCI209

9

String method: charAt

- A String is a collection of chars

```
String testString1 = "Demonstrate Strings";

char character1;
char character2 = testString1.charAt(3);
character1 = testString1.charAt(2);
```

Sept 14, 2016

Sprenkle - CSCI209

10

String methods: substring

- Like *slicing* in Python
- String `substring(int beginIndex)`
 - Returns a new String that is a substring of this string, from `beginIndex` to end of this string
- String `substring(int beginIndex, int endIndex)`
 - Returns a new String that is a substring of this string, from `beginIndex` to `endIndex-1`

```
String language = "Java!";
String subStr = language.substring(1);
String subStr2 = language.substring(2, 4);
```

Python Gotcha: Can't use negative numbers for indices as in Python

String Concatenation

- Use `+` operator to concatenate Strings

```
String niceGreeting = "Hello";
String firstName = "Clark";
String lastName = "Kent";
String blankSpace = " ";

String greeting = niceGreeting + "," +
    blankSpace + firstName +
    blankSpace + lastName;

System.out.println(greeting);
```

Prints "Hello, Clark Kent"

String Concatenation

- If a `String` is concatenated with something that is not a `String`, the other variable is converted to a `String` automatically.

```
int totalPoints = 110;
int earnedPoints = 87;
float testScore = (float) earnedPoints/totalPoints;

System.out.println("Your score is " + testScore);
```

Converted to a `String`

StringBuilders vs Strings

- `Strings` are “read-only” or *immutable*
 - Same as Python
- Use `StringBuilder` to manipulate a `String`
- Instead of creating a new `String` using
 - `String str = prevStr + " more!";`

- Use `new` keyword:
 - allocate memory to a new object

```
StringBuilder str = new StringBuilder( prevStr );
str.append(" more!");
```

- Many `StringBuilder` methods
 - `toString()` to get the resultant string back

Effective Java: Code Inefficiency

- Avoid creating unnecessary objects:

```
String s = new String("text"); // DON'T DO THIS
```

- Do this instead:

```
String s = "text";
```

Why?

String Comparison: equals

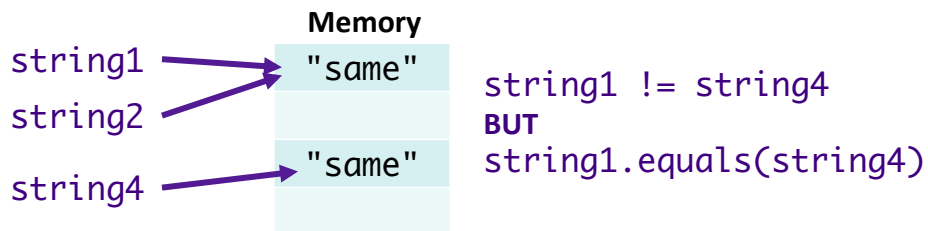

- **boolean** equals(Object anObject)
 - Compares this string to the specified object

```
String string1 = "Hello";
String string2 = "hello";
boolean test;
test = string1.equals(string2);
```

- **test** is false because the Strings contain different values

Python Gotcha: String Comparisons

- `string1 == string4` will **not** yield the same result as `string1.equals(string4)`
 - `==` tests if the *objects* are the same
 - **not** if the *contents* of the objects are the same
 - Similar to `is` operator in Python

Sept 14, 2016

Sprenkle - CSCI209

Equals.java

17

String method: equalsIgnoreCase

- Does what it's named!

```
String string1 = "Hello";
String string2 = "hello";
boolean test;
test = string1.equalsIgnoreCase(string2);
```

- `test` is true!

Sept 14, 2016

Sprenkle - CSCI209

18

String methods: and many more!

- `boolean` `endsWith(String suffix)`
- `boolean` `startsWith(String prefix)`
- `int` `length()`
- `String` `toLowerCase()`
- `String` `trim()`: remove trailing and leading white space
- ...
- See `java.lang.String` API for all

CONTROL STRUCTURES

Review

- What is the syntax of a *conditional statement* in Python?

Sept 14, 2016

Sprenkle - CSCI209

21

Control Flow: Conditional Statements

• **if** statement

- **Condition** must be surrounded by `()`
- Condition must evaluate to a **boolean**
- Body is enclosed by `{ }` if multiple statements

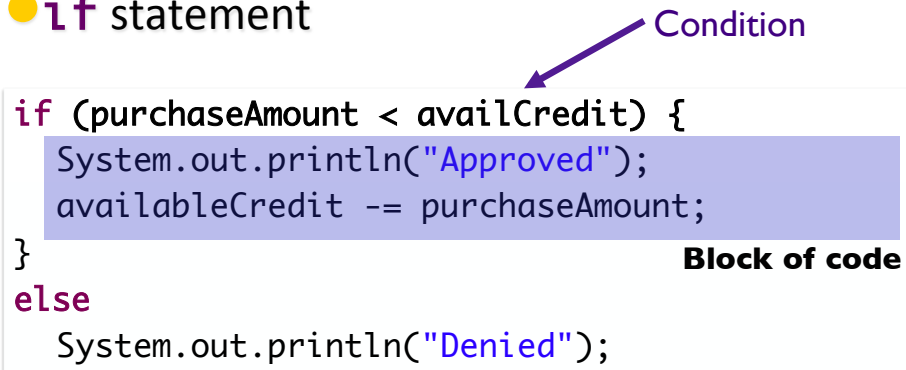

```
if (purchaseAmount < availCredit) {
    System.out.println("Approved");
    availableCredit -= purchaseAmount;
}
else
    System.out.println("Denied");
```

Don't need `{ }` if only one statement in the body
Best practice: use `{ }`

Sept 14, 2016

Control Flow: Conditional Statements

● **if** statement

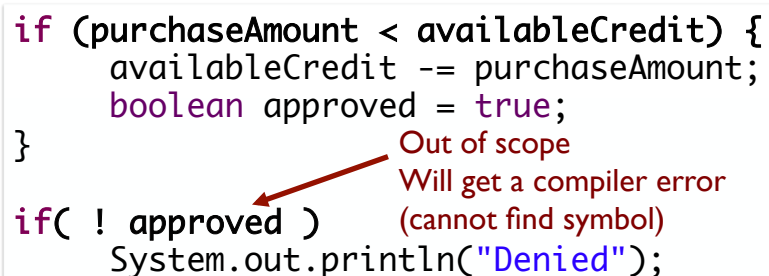

```

if (purchaseAmount < availCredit) {
    System.out.println("Approved");
    availableCredit -= purchaseAmount;
}
else
    System.out.println("Denied");
  
```

- Everything between { } is a block of code
 - Has an associated scope

Scoping Issues: Python Gotcha

- Everything between { } is a block of code
 - Has an associated *scope*

```

if (purchaseAmount < availableCredit) {
    availableCredit -= purchaseAmount;
    boolean approved = true;
}

if( ! approved )
    System.out.println("Denied");
  
```

How do we fix this code?

Fixed

- Move `approved` outside of the `if` statement

```
boolean approved = false;
if (purchaseAmount < availableCredit) {
    availableCredit -= purchaseAmount;
    approved = true;
}

if( ! approved )
    System.out.println("Denied");
```

Logical Operators

Operation	Python	Java
AND		&&
OR		
NOT		!

In Python, these are ...?

Logical Operators

Operation	Python	Java
AND	and	&&
OR	or	
NOT	not	!

Control Flow: else if

- In Python, was `elif`

```

if( x%2 == 0 ) {
    System.out.println("Value is even.");
}
else if ( x%3 == 0 ) {
    System.out.println("Value is divisible by 3.");
}
else {
    System.out.println("Value isn't divisible by 2 or 3.");
}

```

What output do we get if x is 9, 13, and 6?

Control Flow: **switch** statement

- Like a big **if/else if** statement
- Works with variables with datatypes **byte**, **short**, **char**, **int**, and **String**

```
int x = 3;
switch(x) {
    case 1:
        System.out.println("It's a 1.");
        break;
    case 2:
        System.out.println("It's a 2.");
        break;
    default:
        System.out.println("Not a 1 or 2.");
}
```

Control Flow: **switch** statement

```
switch(grade) {
    case 'a':
    case 'A':
        System.out.println("Congrats!");
        break;
    case 'b':
    case 'B':
        System.out.println("Not too shabby!");
        break;
    ... // Handle c, d, and f ...
    default:
        System.out.println("Error: not a grade");
}
```

Control Flow: while Loops

- **while** loop

- Condition must be enclosed in parentheses
- Body of loop must be enclosed in `{}` if multiple statements

```
int counter = 0;
while (counter < 5) {
    System.out.println(counter);
    counter++; ← shortcut
}
System.out.println("Done: " + counter);
```

Sept 14, 2016

Sprenkle - CSCI209

31

Changing control flow: break

- Exits the current loop

```
while ( <readingdata> ) {
    ...
    if( <somethingbad> ) { // shouldn't happen
        break;
    }
}
```

Sept 14, 2016

Sprenkle - CSCI209

32

Review

- How do you write a **for** loop in Python for counting?

Control Flow: **for** Loop

- Very different syntax from Python
- Syntax:

```
for (<init>; <condition>; <execution_expr>)
```

↑
Loop's counter variable,
Usually used in condition

↑
Executed at end of each iteration.
Typically increments or
decrements counter

Control Flow: for Loop Example

```
System.out.println("Counting down...");
for (int count=5; count >= 1; count--) {
    System.out.println(count);
}
System.out.println("Blastoff!");
```

↑ shortcut

- What is the counter variable?
- What is the condition?
- What is the output?
- How written in Python?

Can't print out count
with Blastoff. Why?

ARRAYS

Python Lists → Java Arrays

- A Java **array** is like a *fixed-length* list
- To declare an array of integers:
 - `int[] arrayOfInts;`
 - Declaration only makes a variable named `arrayOfInts`
 - Does not initialize array or allocate memory for the elements
- To declare *and initialize* array of integers:

```
int[] arrayOfInts = new int[100];
```

`new` keyword:
allocate memory to a new object

Sept 14, 2016

Sprer

Array Initialization

- Initialize an array at its declaration:
 - `int[] fibNums = {1, 1, 2, 3, 5, 8, 13};`

Value	1	1	2	3	5	8	13
Position/index	0	1	2	3	4	5	6

- Note that we do not use the `new` keyword when allocating and initializing an array in this manner
- `fibNums` has length 7

Sept 14, 2016

Sprenkle - CSCI209

38

Array Access

- Access a value in an array as in Python:
 - `fibNums[0]`
 - `fibNums[x] = fibNums[x-1] + fibNums[x-2]`
- Unlike in Python, **cannot** use negative numbers to index items

Sept 14, 2016

Sprenkle - CSCI209

39

Array Length

- All array variables have a *field* called `length`
 - Note: no parentheses because not a method

```
int[] array = new int[10];
for (int i = 0; i < array.length; i++) {
    array[i] = i * 2;
}

for (int i = array.length-1; i >= 0; i--) {
    System.out.println(array[i]);
}
```

Sept 14, 2016

Sprenkle - CSCI209 `ArrayLength.java` 40

Overstepping Array Length

- Java safeguards against overstepping length of array
 - Runtime Exception: “Array index out of bounds”
 - More on exceptions later...

- Example

```
int[] array = new int[100];
```

- Attempts to access or write to index < 0 or index >= array.length (100) will generate exception

Sept 14, 2016

Sprenkle - CSCI209

41

Arrays

- Assigning one array variable to another → both variables refer to the same array
 - Similar to Python
- Draw picture of below code:

```
int [] fibNums = {1, 1, 2, 3, 5, 8, 13};
int [] otherFibNums;

otherFibNums = fibNums;
otherFibNums[2] = 99;

System.out.println(otherFibNums[2]);
System.out.println(fibNums[2]);
```

fibNums[2] and otherFibNums[2] are both equal to 99

Sept 14, 2016

Sprenkle - CSCI209

42

Array Copying

- Copy an array (element-by-element) using the `arraycopy` method in the `System` class

```
System.arraycopy(from, fromIndex, to, toIndex, count);
```

- For example:

```
int[] fibNums = {1, 1, 2, 3, 5, 8, 13};
int[] otherNums = new int[fibNums.length];
System.arraycopy(fibNums, 0, otherNums, 0, fibNums.length);
otherNums[2] = 99;
System.out.println(otherNums[2]);
System.out.println(fibNums[2]);
```

```
fibNums[2] = 2,
otherNums[2] = 99
```

Sept 14, 2016

Sprenkle - CSCI209

43

Control Flow: `foreach` Loop

- Introduced in Java 5
 - Sun calls “enhanced for” loop
- Iterate over all elements in an array (or Collection)
 - Similar to Python’s `for` loop

```
int[] a;
int result = 0;
. . .
for (int i : a)
{
    result += i;
}
```

<http://docs.oracle.com/javase/1.5.0/docs/guide/language/foreach.html>

for each `int` element `i` in the array `a`, the loop body is visited once for each element of `a`.

Sept 14, 2016

Sprenkle - CSCI209

44

java.util.Arrays

- `Arrays` is a class in `java.util`
- Methods for sorting, searching, `deepEquals`, fill arrays
- To use class, need `import` statement
 - Goes at top of program, before class definition

```
import java.util.Arrays;
```

`ArraysExample.java`

Sept 14, 2016

Sprenkle - CSCI209

45

Summary: Python to Java Gotchas

- Every variable needs to be declared before it is used
- Every variable needs a statically-declared data type
- Scope of variables
- Syntax
 - Semicolons at the end of **statements**
 - Braces around blocks of code
 - Keywords

Sept 14, 2016

Sprenkle - CSCI209

46
