

# Objectives

- Wrap up: Implementing BFS and DFS
- Graph Application: Bipartite Graphs

Get out your BFS implementation handouts

# Review

- What are two ways to find a connected component?
  - How are their results similar? Different?

# Review: Breadth-First Search

- **Intuition.** Explore outward from  $s$  in all possible directions (edges), adding nodes one "layer" at a time

- **Algorithm**

- $L_0 = \{s\}$

- $L_1 =$  all neighbors of  $L_0$

- $L_2 =$  all nodes that have an edge to a node in  $L_1$  and do not belong to  $L_0$  or  $L_1$

- $L_{i+1} =$  all nodes that have an edge to a node in  $L_i$  and do not belong to an earlier layer

# Analysis

$O(n^3)$

```
BFS(s, G):
  Discovered[v] = false, for all v
  Discovered[s] = true
  L[0] = {s}
  layer counter i = 0
  BFS tree T = {}
  while L[i] != {}
    L[i+1] = {}
    For each node u ∈ L[i]
      Consider each edge (u,v) incident to u
      if Discovered[v] == false then
        Discovered[v] = true
        Add edge (u, v) to tree T
        Add v to the list L[i + 1]
    i += 1
```

n

At most n

At most n-1

At most n-1

i += 1

# Analysis: Tighter Bound

```
BFS(s, G):
  Discovered[v] = false, for all v
  Discovered[s] = true
  L[0] = {s}
  layer counter i = 0
  BFS tree T = {}
  while L[i] != {}
    L[i+1] = {}
    For each node u ∈ L[i]
      Consider each edge (u,v) incident to u
      if Discovered[v] == false then
        Discovered[v] = true
        Add edge (u, v) to tree T
        Add v to the list L[i + 1]
    i += 1
```

$O(n^2)$

At most n

At most n-1

Because we're going to look at each node at most once

# Analysis: Even Tighter Bound

$$\sum_{u \in V} \deg(u) = 2m$$

```
BFS(s, G):
  Discovered[v] = false, for all v
  Discovered[s] = true
  L[0] = {s}
  layer counter i = 0
  BFS tree T = {}
  while L[i] != {}
    L[i+1] = {}
    For each node u ∈ L[i]
      Consider each edge (u,v) incident to u
      if Discovered[v] == false then
        Discovered[v] = true
        Add edge (u, v) to tree T
        Add v to the list L[i + 1]
    i+=1
```

*n*

*At most n*

$O(\deg(u))$

→  $O(n+m)$

# Implementing DFS

- What do we need as input?
- What do we need to model?
  - How will we model that?
  - Pseudo code

```
DFS(u):  
  Mark  $u$  as “Explored” and add  $u$  to  $R$   
  For each edge  $(u, v)$  incident to  $u$   
    If  $v$  is not marked “Explored” then  
      DFS( $v$ )
```

# Implementing DFS

- Keep nodes to be processed in a *stack*

```
DFS(s, G):
  Initialize S to be a stack with one element s
  Explored[v] = false, for all v
  Parent[v] = 0, for all v
  DFS tree T = {}
  while S != {}
    Take a node u from S
    if Explored[u] = false
      Explored[u] = true
      Add edge (u, Parent[u]) to T (if u ≠ s)
      for each edge (u, v) incident to u
        Add v to the stack S
        Parent[v] = u
```

What is the runtime?

How many times is a node added/removed from the stack?

# Analyzing DFS

$O(n+m)$

```
DFS(s, G):
  Initialize S to be a stack with one element s
  Explored[v] = false, for all v
  Parent[v] = 0, for all v
  DFS tree T = {}
  while S != {}
    Take a node u from S
    if Explored[u] = false
      Explored[u] = true
      Add edge (u, Parent[u]) to T (if u ≠ s)
    deg(u) for each edge (u, v) incident to u
      Add v to the stack S
      Parent[v] = u
```

A node is added/removed from the stack  $2 \cdot \text{deg}(u)$   
All nodes are added  $2m = O(m)$  times

# Analyzing Finding All Connected Components

- How can we find the set of all connected components of the graph?

```
R* = set of connected components (a set of sets)
while there is a node that does not belong to R*
    select s not in R*
    R = {s}
    while there is an edge (u,v) where  $u \in R$  and  $v \notin R$ 
        add v to R
    Add R to R*
```

But the inner loop is  $O(m+n)$ !  
How can this RT be possible?

Claim: Running time is  $O(m+n)$

# Set of All Connected Components

- How can we find the set of all connected components of the graph?

$R^*$  = set of connected components (a set of sets)

while there is a node that does not belong to  $R^*$

select  $s$  not in  $R^*$

$R = \{s\}$

while there is an edge  $(u,v)$  where  $u \in R$  and  $v \notin R$   
add  $v$  to  $R$

Add  $R$  to  $R^*$

Imprecision in the running time  
of inner loop:  $O(m+n)$

But that's  $m$  and  $n$  of the  
**connected** component,  
let's say  $m_i$  and  $n_i$ .

$$\sum_i O(m_i + n_i) = O(m+n)$$

Where  $i$  is the subscript of the  
connected component

# BIPARTITE GRAPHS

# Bipartite Graphs

- **Def.** An undirected graph  $G = (V, E)$  is **bipartite** if the nodes can be colored **red** or **blue** such that every edge has one red and one blue end
  - Generally: vertices divided into sets  $X$  and  $Y$
- Applications:
  - Stable marriage:
    - men = red, women = blue
  - Scheduling:
    - machines = red, jobs = blue

# Testing Bipartiteness

- Given a graph  $G$ , is it bipartite?
- Many graph problems become:
  - Easier if underlying graph is bipartite (e.g., matching)
  - Tractable if underlying graph is bipartite (e.g., independent set)
- Before designing an algorithm, need to understand structure of bipartite graphs

**a bipartite graph  $G$ :**

**another drawing of  $G$ :**

# How Can We Determine if a Graph is Bipartite?

- Given a connected graph

Why connected?

1. Color one node red

- Doesn't matter which color (Why?)

➤ What should we do next?

- How will we know when we're finished?
- What does this process sound like?

# An Obstruction to Bipartiteness

- **Lemma.** If a graph  $G$  is bipartite, it cannot contain an odd-length cycle.

**bipartite  
(2-colorable)**

**not bipartite  
(not 2-colorable)**

# An Obstruction to Bipartiteness

- **Lemma.** If a graph  $G$  is bipartite, it cannot contain an odd-length cycle.
- **Pf.** Not possible to 2-color the odd cycle, let alone  $G$ .

**bipartite  
(2-colorable)**

**not bipartite  
(not 2-colorable)**

If find an odd cycle,  
graph is NOT bipartite

# How Can We Determine if a Graph is Bipartite?

- Given a connected graph
  - Color one node red
    - Doesn't matter which color (Why?)
  - What should we do next?
- How will we know that we're finished?
- What does this process sound like?
  - BFS: alternating colors, layers

How can we implement the algorithm?

# Implementing Algorithm

- Modify BFS to have a Color array
- When add  $v$  to list  $L[i+1]$ 
  - $\text{Color}[v] = \text{red}$  if  $i+1$  is even
  - $\text{Color}[v] = \text{blue}$  if  $i+1$  is odd

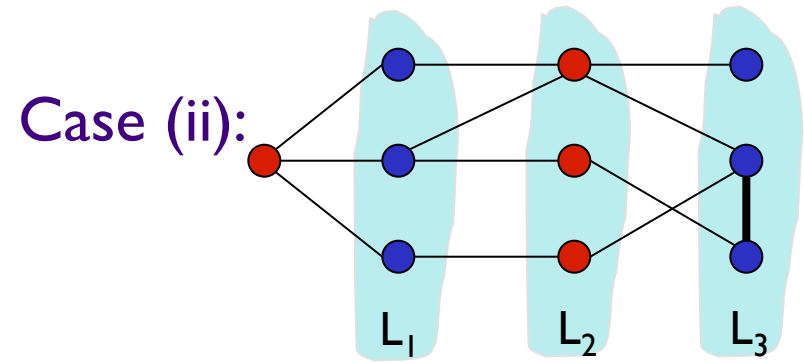

What is the running time of this algorithm?  **$O(n+m)$**

Marks a change in how we think about algorithms  
Starting to apply known algorithms to solve new problems

# Analyzing Algorithm's Correctness

- **Lemma.** Let  $G$  be a connected graph, and let  $L_0, \dots, L_k$  be the layers produced by BFS starting at node  $s$ . Exactly one of the following holds:
  - (i) No edge of  $G$  joins two nodes of the same layer  
➡  $G$  is bipartite
  - (ii) An edge of  $G$  joins two nodes of the same layer  
➡  $G$  contains an odd-length cycle and hence is not bipartite

# Analyzing Algorithm's Correctness

- **Lemma.** Let  $G$  be a connected graph, and let  $L_0, \dots, L_k$  be the layers produced by BFS starting at node  $s$ . Exactly one of the following holds:
  - (i) No edge of  $G$  joins two nodes of the same layer  
➔  $G$  is bipartite
- **Pf. (i)**
  - Suppose no edge joins two nodes in the same layer
  - Implies all edges join nodes on adjacent level
  - **Bipartition**
    - red = nodes on odd levels
    - blue = nodes on even levels

# Analyzing Algorithm's Correctness

- **Lemma.** Let  $G$  be a connected graph, and let  $L_0, \dots, L_k$  be the layers produced by BFS starting at node  $s$ . Exactly one of the following holds:
  - (ii) An edge of  $G$  joins two nodes of the same layer  $\rightarrow$   $G$  contains an odd-length cycle and hence is not bipartite
- **Pf. (ii)**
  - Suppose  $(x, y)$  is an edge with  $x, y$  in same level  $L_j$ .
  - Let  $z = \text{lca}(x, y) =$  lowest common ancestor
  - Let  $L_i$  be level containing  $z$
  - Consider cycle that takes edge from  $x$  to  $y$ , then path  $y \rightarrow z$ , then path from  $z \rightarrow x$

# Analyzing Algorithm's Correctness

- Lemma.** Let  $G$  be a connected graph, and let  $L_0, \dots, L_k$  be the layers produced by BFS starting at node  $s$ . Exactly one of the following holds:
  - (ii) An edge of  $G$  joins two nodes of the same layer  $\rightarrow$   $G$  contains an odd-length cycle and hence is not bipartite
- Pf. (ii)**
  - Suppose  $(x, y)$  is an edge with  $x, y$  in same level  $L_j$ .
  - Let  $z = \text{lca}(x, y)$  = lowest common ancestor
  - Let  $L_i$  be level containing  $z$
  - Consider cycle that takes edge from  $x$  to  $y$ , then path  $y \rightarrow z$ , then path  $z \rightarrow x$
  - Its length is  $\underbrace{1}_{(x,y)} + \underbrace{(j-i)}_{\text{path from } y \text{ to } z} + \underbrace{(j-i)}_{\text{path from } z \text{ to } x}$ , which is odd

# An Obstruction to Bipartiteness

- **Corollary.** A graph  $G$  is bipartite *iff* it contains no odd length cycle.

**bipartite  
(2-colorable)**

**not bipartite  
(not 2-colorable)**

# Looking Ahead

## Goal: Finish graphs before Exam 1

- Wiki: 3.2-3.6
  - Covered in class: 3.2-3.4
  - Expected: 3.5-3.6 on Monday
  - Willing to push wiki to Tuesday at 11:59 p.m.
- PS 4 – due Friday
  - First two problems – know how to do now
  - Second two problems should wait until after Monday's class
